1 Functional requirement of the program

1.1 The project

The goal of this project is to simulate the movement of a fluid through different geometries. The program create a box of choosen size, builds a geometry inside it and simulates the movement of a given fluid.

1.2 The files

In order to increase readability, the project is made of several files. I made the choice to work with Object Oriented Programming.

- `main.py`: This file calls for the needed functions/class
- `matrices.py`: This file contains the class “Matrices”, it builds the geometry, the different matrices to plot and stores them
- `plot.py`: This file plots the matrices built in “matrices.py”
- `parameters.py`: This file contains all the variables that can be changed by the user
- `data_check.py`: This file checks the variables and makes sure that the program will run

1.3 The data

This project uses several piece of data set by the user to work.

- Nx and Ny are the size of the domain
- h represents the size of a cell
- *geometry* corresponds to the choosen geometry
- *angle* corresponds to the angle of the widening/shrinkage geometry
- v_x is the Neuman condition
- ϕ_{ref} is the Dirichlet condition
